# **ENDURO SERIES**

# **TECHNICAL MANUAL**

Revision No: 01

- · Domestic and industrial raw sewage waste transport
- Sewage treatment plants
- · Liquids containing sludge and solid particles transport
- Factory waste water transport
- Liquids containing fibrous particles and other applications

## **Pumped Liquids**

Clean water, non-corrosive and non-flammable liquids, wastewater, sewage, liquids containing fibrous particles, domestic wastewater, and wastewater treatment plants, flood waters, biological fluids, fluids containing solid.

Please contact MAS DAF MAKINA SANAYI A.Ş. for special applications.

#### Design

- ENDURO submersible pumps designed and manufactured according to the TS 12599 standard.
- In electrical motor winding, in F insulation class cable has been used according to TS 60085:2011. User and motor security is at the forefront by using a 2, 4 or 6 pole induction motor that has IP 68 protection class in accordance with TS 3033 EN 60529.
- It has possibility of use in several fields with special impeller design and ability of pump different wastewater depending on impeller structure.
- ENDURO submersible pumps, produced with modern casting and manufacturing technologies, can be made of different materials according to the application field and customer demands.
- In the components of the pump motor housing and the motor cable in the place of entry into casing, all sealing precautions are taken to be no leakage into the motor.
- Stuffing box in the helical structure having a creative design, keeps solid particles contained in the waste water away from the mechanical seal, thus it protects mechanical seal and offers a long operating life.
- An electrode system is used in case of water leakage caused by worn out mechanical seal or any other reason.
- Through the use of thermistor, protection is provided against motor overheating.
- H07RN-F special type cables are used according to TS EN 50525-2-21 standard. The core colors of the cable are selected according to HD 308.El4 Type (EPR) rubber is used as an isolated material that is resistant against the corrosive effect of the waste water.

#### Shaft

Rotor shafts, which are used in ENDURO Series pumps, are completely AISI 420 stainless steel material. The shafts are manufactured in our modern machinery, with fine grinding has been made more precise. So that the rotor and pump impeller is designed to make a minimum deflection on the same shaft. According to usage space and customer requirements, the shaft can be made of suitable different materials.

# Mas Grup

#### **Bearings**

 $3300,\ 6200$  and 6300 Series bearings are used in ENDURO type pump.

#### Shaft Seal

- SiC surface mechanical seals are used in ENDURO type pump.
- According to the size of the pump with double mechanical seal application has been made more secure seal.
- The mechanical seal friction on the surface is fixed by the pumped liquid.

Please consult MAS DAF MAKINA SANAYI A.Ş for choosing mechanical seal and O-Ring if pumped liquids are different from water.

#### **Technical Data**

Discharge Flanges Operating Pressure Impeller Diameter Q Hm Speed Temperature Pressure (P<sub>max</sub>) DN 50 - DN 200 (PN 10 – PN 16) 10 bar ø140 - ø360 20 - 600m<sup>3</sup>/h 10 - 45m. 1000 - 3600 d/d. Up to 40 °C 10 bar

If the pump is diving deeper than the depth of 7 meters from the surface of the liquid, please notify in your orders.

#### Driver

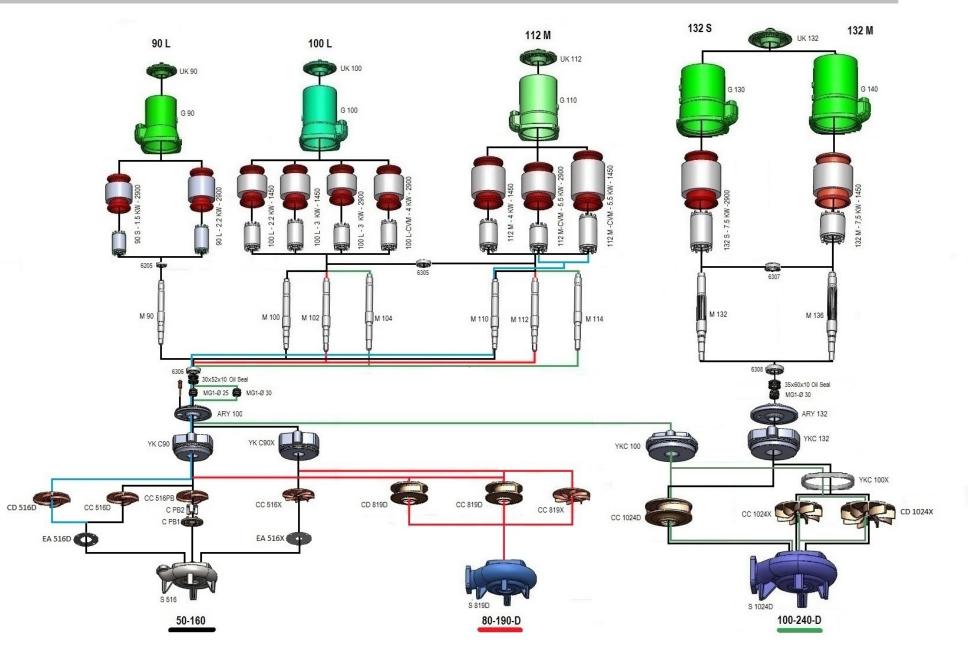

All ENDURO Series pumps are driven by electric motors according to IE2 efficiency class.Electric motors are used IE3 efficiency class according to customer requirements.

# ENDURO Series Submersible Sewage And Wastewater Pumps Common Part Table

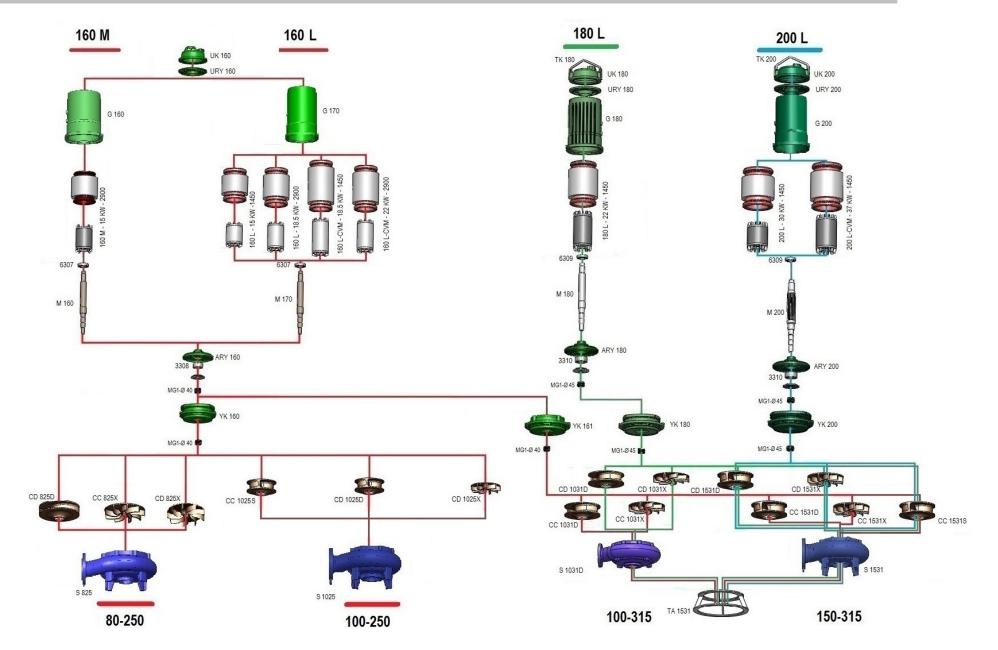

# ENDURO Series Submersible Sewage And Wastewater Pumps Common Part Table

#### ENDURO Series Submersible Sewage And Wastewater Pumps Common Part Table

# X Type Vortex Impellers

In this type of impellers, liquid transfer is provided by vortex movement in front of impeller.Liquids are supplied transmission to the discharge flange by reducing contact the impeller. These types of impellers are suitable for pumping liquids containing long fibers (hair, thread, etc.), small solid particles and having a certain rate gaseous or air.

- Raw Sewage
- Activated Sludge
- Circulated and Heated Sludge
- Wastewater Containing Hair, Thread etc.

# S Type Single Vane Impellers

These types of impellers for liquids containing long fibers, big solid particles (close to the diameter of the pump intake).

- Raw Sewage
- Solid Liquid Mixtures
- Raw and Digested Sludge
- Activated Sludge
- Circulated and Heated Sludge

## D Type Double Vane Impellers

These types of impellers for liquids containing up to certain size sludge and solid particles but not containing fiber, gaseous or air. Its symmetrical design provides balanced operation without vibration.

- Grilled Sewage
- Mechanically Purified Sewage
- Industrial Wastewater
- Activated Sludge
- Floodwaters

## Grinding Blade Design

ENDURO Series submersible sewage and waste water pumps which have grinding blade design, can grind solid particles and fibers inside liquids and transport to the system. Thus, the blockage does not occur Enduro Submersible Pumps.

Special design grinding system is designed to work in accordance with difficult conditions. Grinding blades are manufactured from stainless steel which resistance corrosive effects with precision casting technology and have been made capable of against wear and tear at the most difficult operating conditions after heat treatment process.

#### ENDURO Series Submersible Sewage And Wastewater Pumps Assembly And Installation

#### Automatic Coupling System

The automatic coupling system easily connected and removal of the pump to the installation is to provide an improved system. It is not necessary doing some operations such as emptying the sump, where the pump is, and installing and uninstalling bolt, etc. to make the pump flange-pipe connections during the coupling.

#### Necessary Parts for the Automatic Coupling System

- 1. Carrier Elbow: It is a special strong and broad-based elbow which placed to the sump base before starting up. This elbow carries the weight of the pump. Therefore it must be assembled very stable to sump base.
- Slideway: It consists of from two parallel pipes. It is connected to the carrier elbow from the bottom. When lowering down the pump acts as guide. Length is set according to the depth of the tank in place.
- **3. Coupling Hook:** It is a carrier special part, which is connected to the discharge flange of the pump.
- **4. Special Coupling Gasket:** It is a rubber gasket, which located in the coupling hook. Through special shape, it prevents water leakage by expanding while the pump is running.
- **5. Carrier Chain:** It provides to dip the pump to the water. It is given with all ENDURO type pumps.

#### **Operation of the Automatic Coupling System**

Figure 2

Figure 4

**Figure 1:** When suspended from the rear suspension hole pump stops inherently slightly tilted. In this case, the hook is passed to slideway.

Figure 2: The pump is slid down in inclined state.

**Figure 3:** When the special slots of the hook contact carrier brackets on the elbow, scrolling of the pump stops. Carrier chain is still tense.

**Figure 4:** When the carrier chain has been released, the weight of the pump is loaded to the elbow via hook. The press of the pump's weight to the elbow provides the gasket pressed against the elbow. When the pressure occurs in the pump, gasket prevents water leakage by expanding.

It is adequate the pump is pulled out from the chain for dismantling.

#### **Suspended Connection**

The pump is hanged to the inlet of the pipe system on the ground by a special connecting device. Pump does not sit on the base of the sump. If required, the connection elbow can be used as a non-return valve. Steel discharge pipe between the pump and suspension part keeps the pump on suspension. Suspended connection can apply on 50-160, 50-200 (up to 5,5 kW) and 80-190 types. At suspended connection option, it should be noted that these pumps enables to operate more reliably by not bringing overload to the discharge pipe because of being lighter. It is not necessary for sump bottom to be flat and solid for suspended connection. Suspension elbow and complete suspension set are needed for this application.

#### **Suspended Connection**

#### **Hose Connection**

In this kind of application the pump is sat on the base of the sump. In this application the bottom of the sump should be flat and solid (in order to make the pump not to sink but to stay vertically). The pump is put down to the sump and uplifted by means of a chain. This application is used for small pumps. For ease of assembly and disassembly, should be used the flexible hose as a discharge pipe. Water is pumped up to the surface by a flexible hose and can be connected to a pipe system if necessary.

**Hose Connection** 

Submersible Sewage And Wastewater Pumps Motor Protection and Control Relay

When the device is switched on, all indicator lights blinks in order and the control unit makes a self-check. If there is not any failure, NORMAL indicator light switches on in green indicating it is ready to run the motor.

Water Leakage: In case of water leakage into the motor casing or oil chamber, red indicator light switches on and the relay shuts down the motor. Alarm relay becomes activated and until the RESET button, which located on RELAY, is pressed, alarming goes on by blinking of red indicator light in short periods. In this fault, if the RESET button is not pressed, motor is not stepped in. In this case, must do maintenance by removing the pump and repair the case of water leakage. The sign by blinking continues until you press the RESET button. When RESET button is pressed, the lamp goes out and the alarm relay is deactivated.

Overheat: In case of overheating of motor windings, in which the temperature exceeds 130°C, the red indicator light switches on and the relay shuts down the motor. Indicator light blinks in short periods at alarming position. When motor has cooled down, relay restarts the motor while alarming goes on until the RESET button is pressed. Pressing the RESET button disables the alarm relay and indicator light stops blinking.

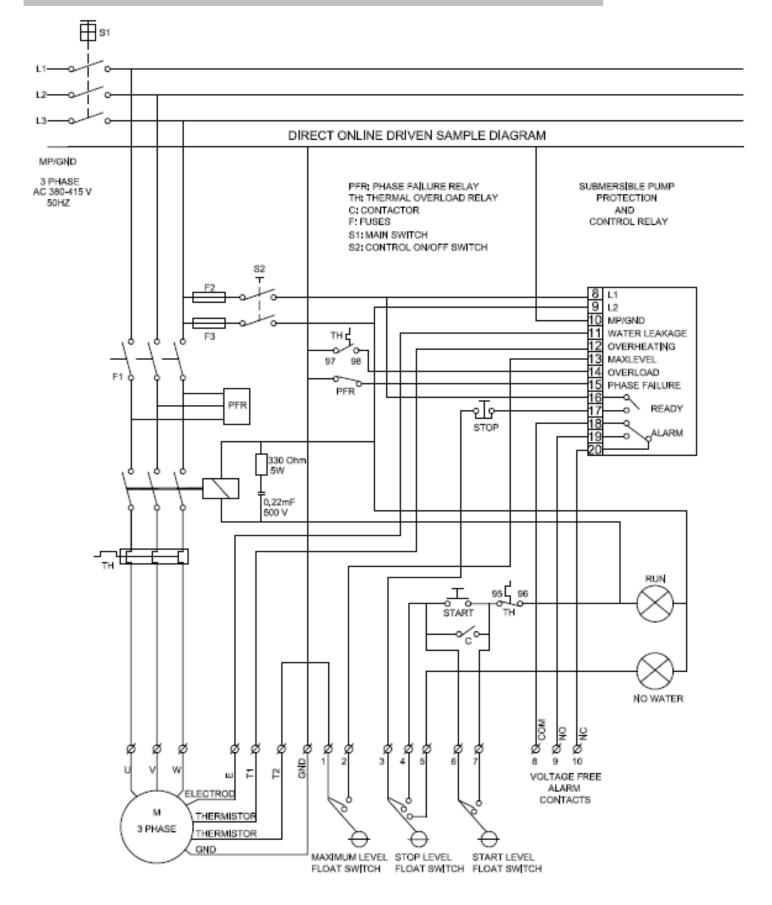

Overload: The relay shuts down the motor, if the current overload limit is exceeded. Alarm relay becomes activated and until the RESET button, which located on RELAY, is pressed, alarming goes on by blinking of red indicator light in short periods. As the failure is fixed, pressing the RESET button will disable the overload and the alarm relay, so the system turns back to normal conditions.

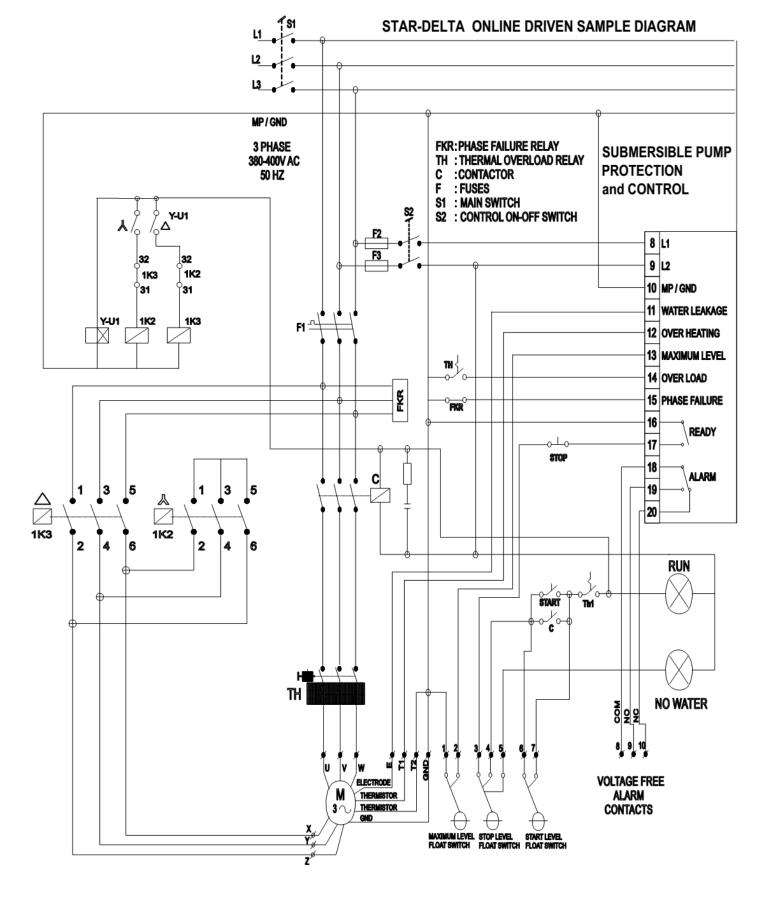

Maximum Level: When water level reaches the maximum level, which is set by the user, float switch sends on alarm signal. MAX yellow indicator light starts blinking. This alarm does not affect the current state (run or stop) of the pump. Pressing the RESET button disables the alarm relay and indicator light stops blinking. When RESET button is pressed, the lamp goes out and the alarm relay is deactivated.

Phase Failure: An external phase protection relay, mounted in the control panel, is connected to RLE-1C for checking phase sequence and phase failures. When there is a failure in mains voltage or in phase sequence, the motor is shut down by the relay and red indicator light starts blinking. By the time the failure is fixed, the motor restarts automatically while alarming goes on until the RESET button is pressed. When RESET button is pressed, the lamp goes out and the alarm relay is deactivated.

Ready: By the time all red indicator lights on RLE-1C switch off, green indicator light switches on, meaning that it is ready to run the motor. In case of failure, green indicator light switches off and the relay shuts down the motor.

MAS

DA

#### Single and Multiple Submersible Pump Control Panel

The control panel is designed in order to safer operation of ENDURO submersible pump can be claimed as extra. Singlepump or the 2 and 3 pump groups can be operated by the control panel.

In the pump operating principle of a multi-pump panel, all pumps can be operated simultaneously or as a backup.

For example, 2 ENDURO submersible pumps are controlled to get on panel of 2 groups. 1st pump is main, 2nd pump is waiting as a backup to run automatically as soon as the 1st pump stops or both are start at the same time for discharge high amounts of liquid.

#### **Control Panel General Features**

- IP 55 protection class: It is isolated from dust, splashing water and wastewater environment gas.
- Short Circuit Protection
- Phase Failure and Protection Against Phase Sequence
- Thermistor Protection
- Water Leakage Protection
- Over Current Protection
- The Indicator Lights
- Manual-Automatic Paco
- Start-Stop As Manual
- The Main Switch

Equipments are available.

Floater is included in the package of submersible pump.

Control panel has all features ofmotor protection and control relay.

#### **ENDURO Submersible Pump Cable Features**

- H07RN-F special type cables are used according to EN 50525-2-21 standard.
- The core colors of the cable are selected according to HD 308.
- El4 Type (EPR) rubber is used as an isolated material that is resistant against the corrosive effect of the waste water.
